## REVEAL HIGHER PROFITS WITH LINX.

If you've been searching for the perfect way to reduce packaging costs, increase profits and enhance flexibility on your production line, look no further. The Linx IJ600 outer case coder allows you to print exceptional quality graphics, text and barcodes on bags and boxes, packaging and containers. By printing on two sides simultaneously and at any angle, it provides a flexible solution to your outer case coding requirements.

The Linx IJ600 twinhead prints high resolution text and graphics comparable to labels and pre-printed stock, significantly reducing your secondary packaging costs. As well as cutting down on bag and box varieties and giving you the ability to print on almost any porous material in any orientation, it also simplifies the operation of your production line.

The Linx IJ600 is a truly flexible addition to your production line. It provides numerous integration options as well as the facility to download more complex messages using the Linx IJ600 Printer Driver or Claricom's CLARISOFT message design software.

In addition to this flexibility, the Linx IJ600 has been developed to provide a robust solution to your production needs.

Ideal for high volume applications in industrial environments, it is built to deliver consistent high quality coding, even in harsh conditions.

As well as offering all these advantages, the Linx IJ600 is also inexpensive to maintain. Its self-cleaning printheads retract while not in use, protecting the nozzles from the

environment and therefore helping to prevent blockages at startup and minimising downtime. A single ink system for both printheads reduces maintenance and downtime even further. All of which makes the Linx IJ600 the only choice for anyone wanting to significantly increase profits.
